

Database Viewer

Version 6.00

View Miva Merchant Database Tables

Overview

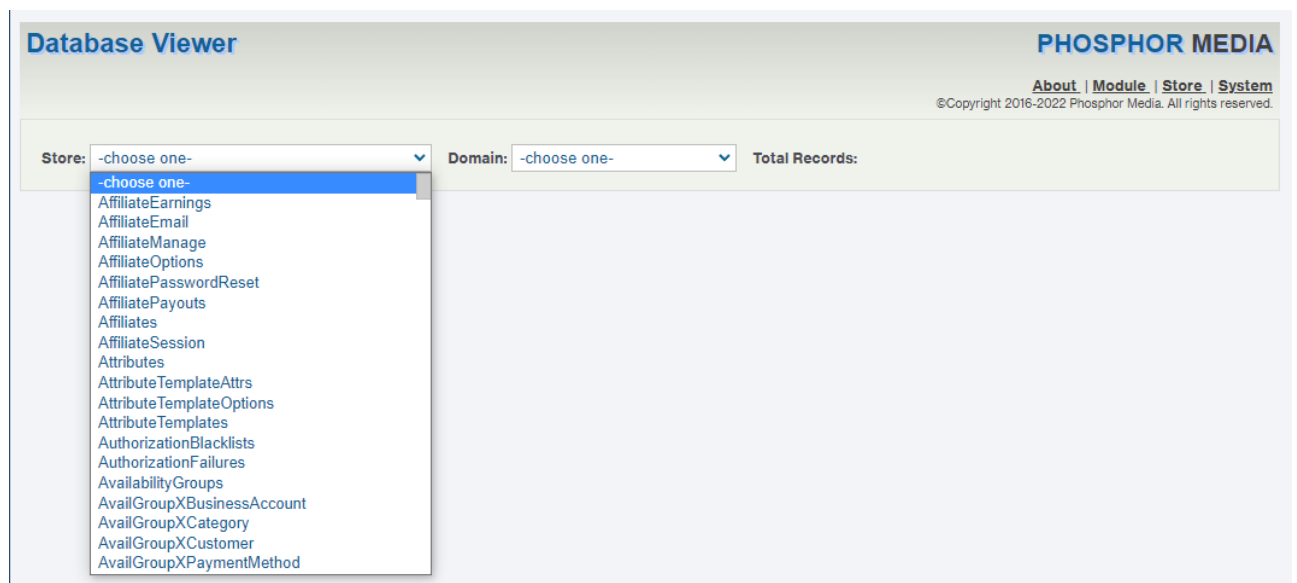

Database Viewer is a module that allows you to view all the database tables associated with your store, whether native Miva tables or third-party tables.

All data is read-only, so you don't need to be concerned about mistakes and inadvertent data loss.

Using Database Viewer

Once the module has been installed and assigned to your store, you will see the main interface – consisting of two select/dropdown controls. One is for Store-level tables (most tables are located here) and Domain-level tables.

When you select a dropdown, you will see a (long) list of tables. Scroll to the one you want and click.

PHOSPHOR MEDIA

your success is our business

The table view is shown below. Each view shows up to 200 rows/records, after which the pagination buttons along the bottom will become enabled.

The column/field names along the top are color-coded by data type (Integer, Boolean, Character, Memo, Number) and have tooltips to identify them.

A Filter control is available that allows you to view only records that match a certain word or fragment of text. Note that the filter is only applied to Character/Memo fields.
